Science LEAP

Are you an entering student and interested in Biology, Chemistry, Math or Physics? This LEAP class may be for you.

Science LEAP is a two semester program designed for students from the College of Science and is intended to aid students in placing the study of science within a broader academic context. In this course students will learn about science as a social process and the role humanities and diversity play in a well-rounded scientific worldview. Through team projects and close student instructor interaction Science LEAP attempts to help science students form a supportive cohort that will continue to function as they proceed through their major. The course develops a student’s skills in reading, researching, writing, critical thinking, working in teams, and presenting material orally and persuasively. The fall semester course fulfills a social science requirement while the spring semester course fulfills one humanities and one diversity requirement.
